Notes:
additional sails and pennant can be found easily on the internet.
I like to add a triangular sail at the front of the corsair but there are none on the original ship. I make one by gluing 2 blank square sails side together and cutting to shape with cissors, sorry no template.
This should be printed on ordinary paper. Sails are to be laminated one plain side with one decorated side and can be formed easily when the glue is not dry yet to look like the wind is blowing.
Sails can be attached to the yards in a variety of ways. If I use wooden yards (toothpicks) I glue them. If I use metal yards (paper clips or wire) it is harder to glue and I tie them to the yard. Very fine copper threads as is found in house hold electrical cabling is good for that.
Length of the mast is one toothpic, minus the bottom point (about 6cm).
